

TreadmillModel

TreadmillModel is a matlab program for FtsZ treadmilling, nucleation and GTP hydrolysis. At current development, users must install matlab to use application.

System Requirements

Access to matlab. Version 2017a - 2019b suggested but backwards compatibility supported. Application was developed to avoid dependencies on toolboxes.

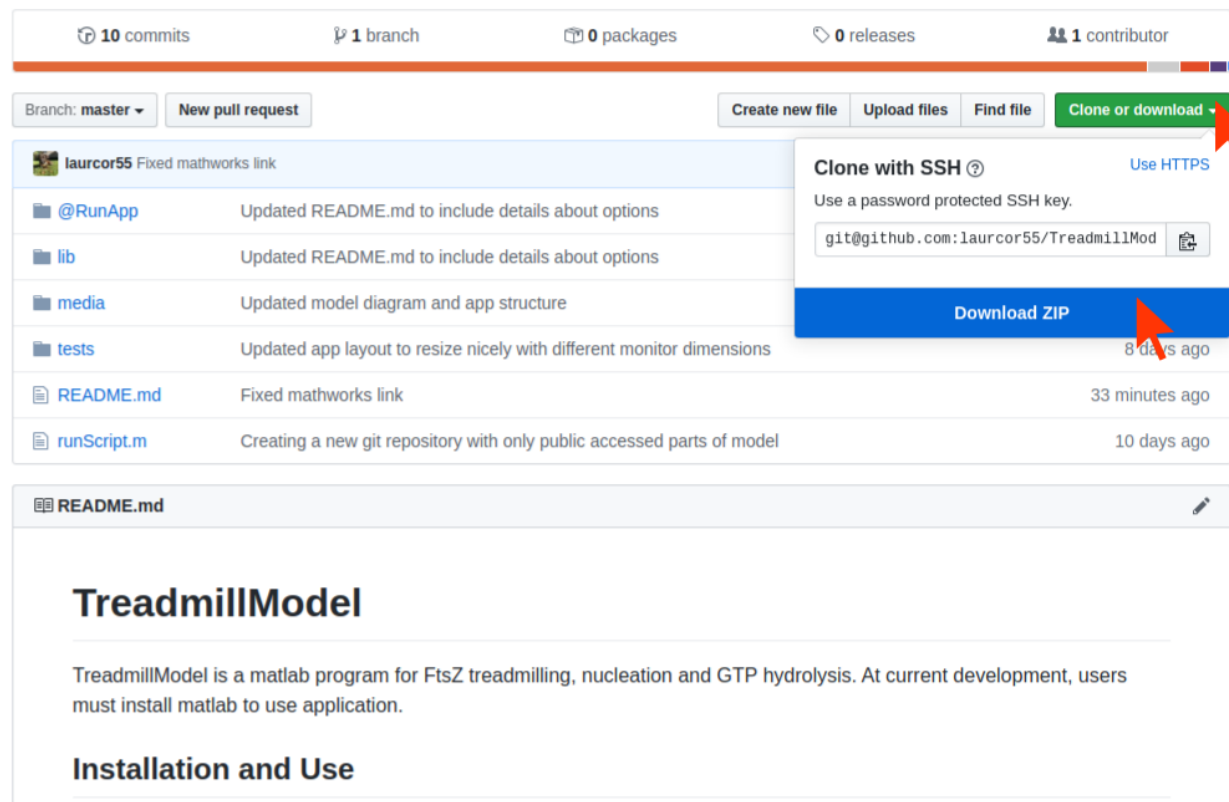

Installation and Running App

1. Install matlab from [MathWorks](#).
2. In web browser, visit [GitHub repository](#). Click **Clone or Download** and **Download Zip**. Unzip folder and move the folder `/TreadmillModel-master` to `Documents/MATLAB` folder

Final version of Monte Carlo model with user interface.

TreadmillModel

TreadmillModel is a matlab program for FtsZ treadmilling, nucleation and GTP hydrolysis. At current development, users must install matlab to use application.

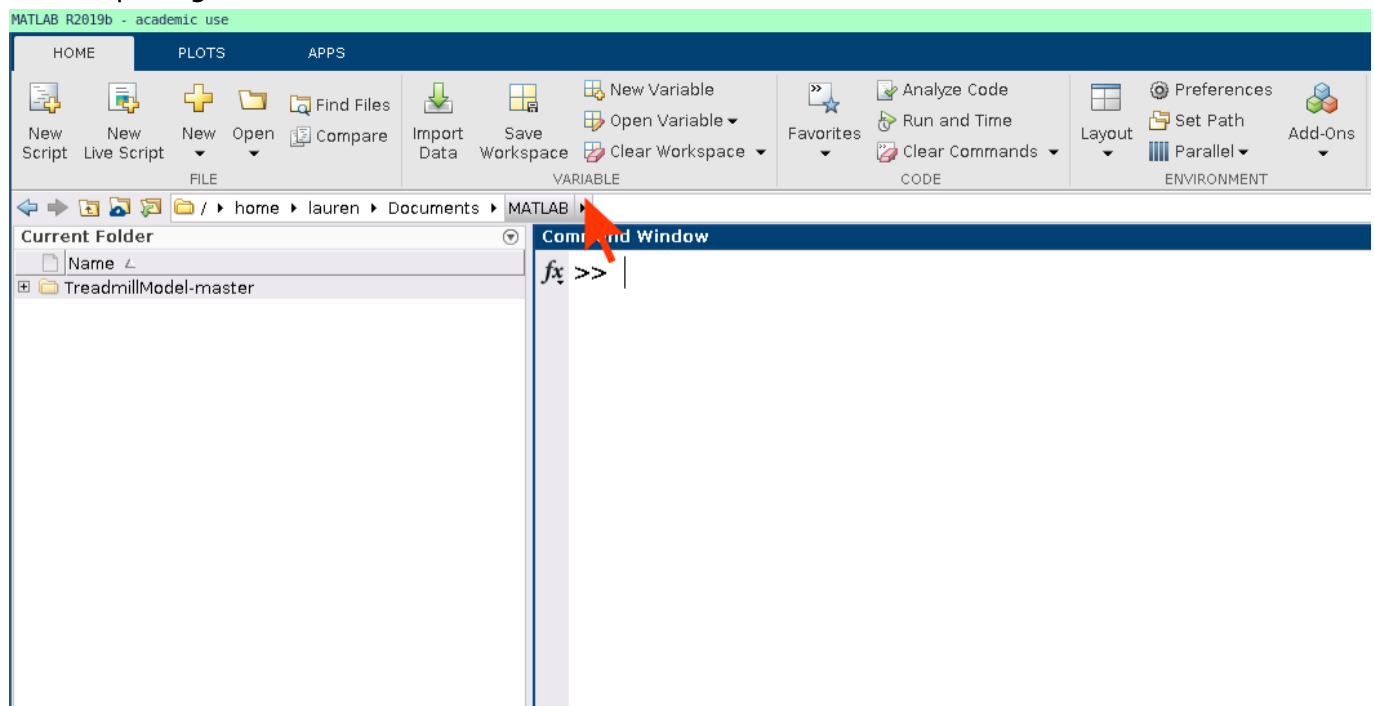

Installation and Use

3. Open matlab and navigate to the `TreadmillModel-master` directory by typing the following into the command window.

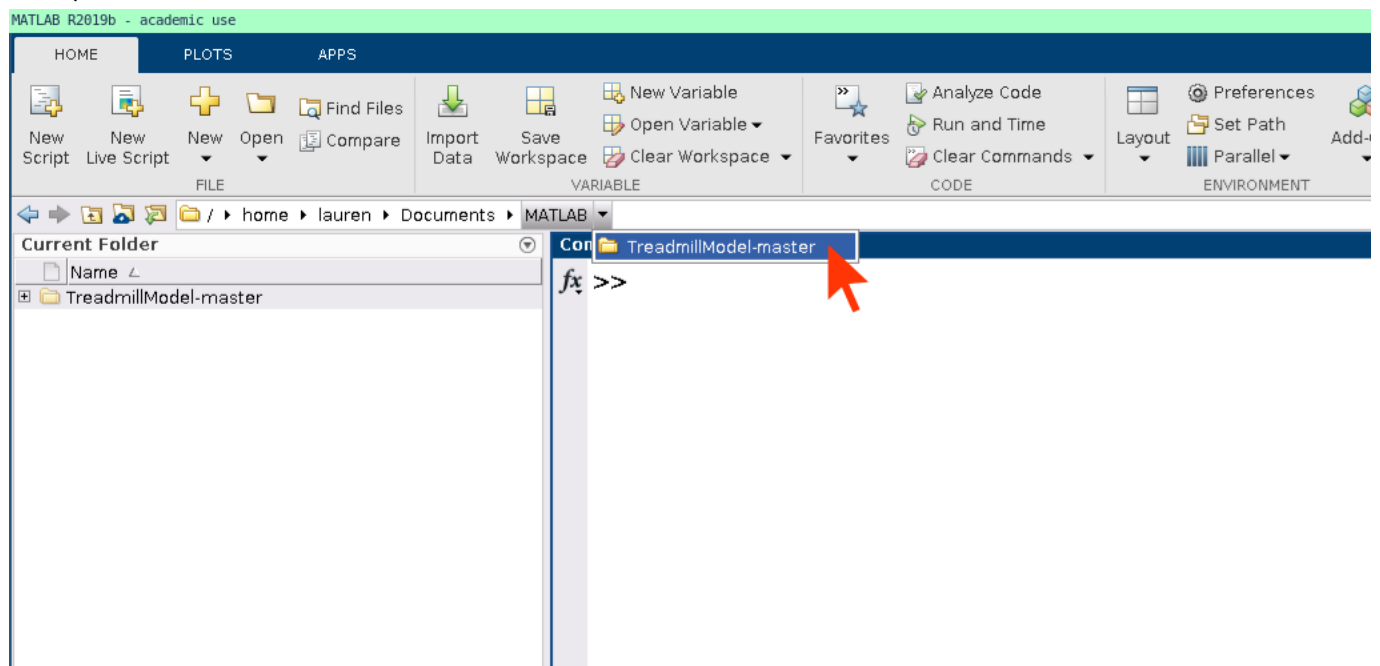

```
>> cd TreadmillModel-master
```

Alternatively, users can navigate to the folder by first clicking the small arrow beside the MATLAB directory in the top navigation bar.

Then, users select **TreadmillModel-master** folder.

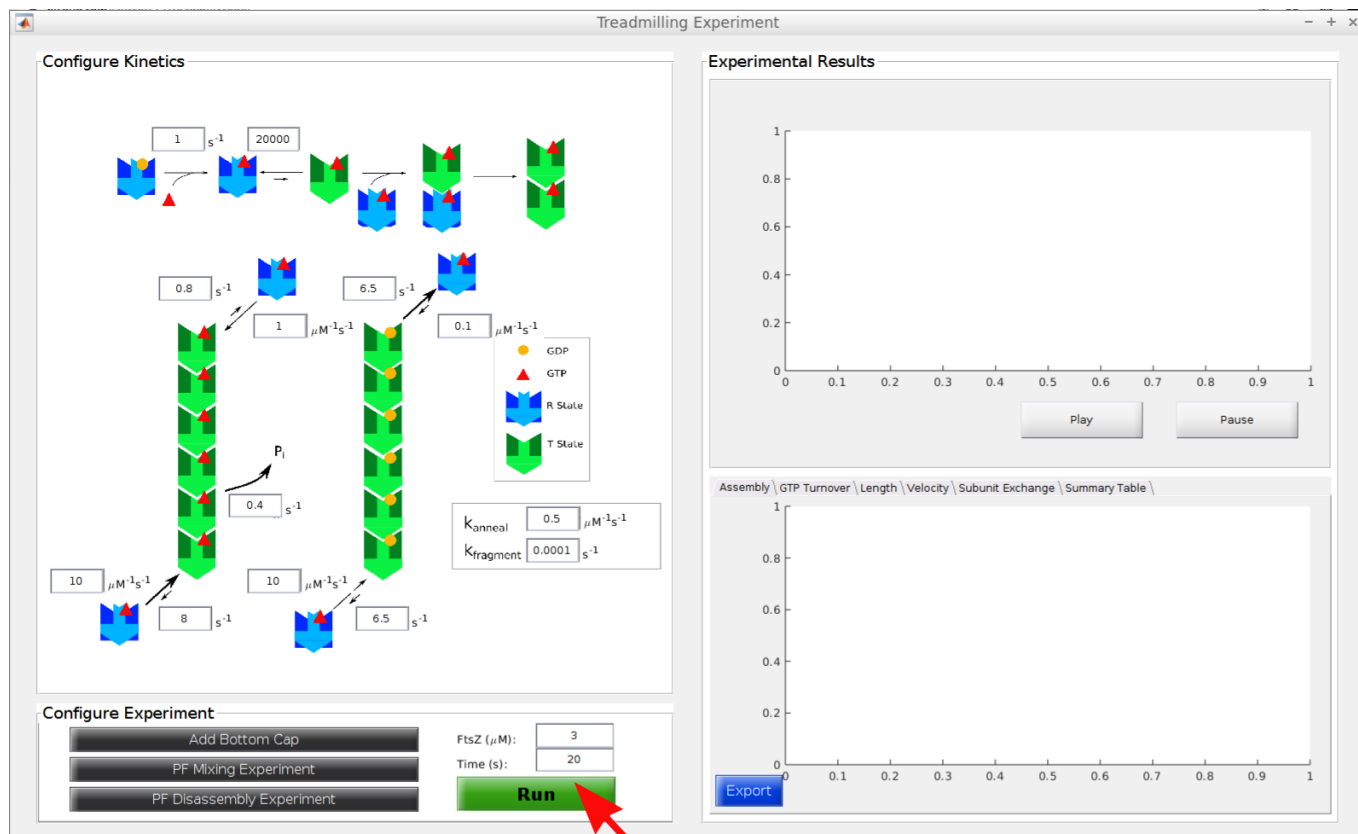

4. Run app by typing **RunApp** in command window and press **Enter** on the keyboard.

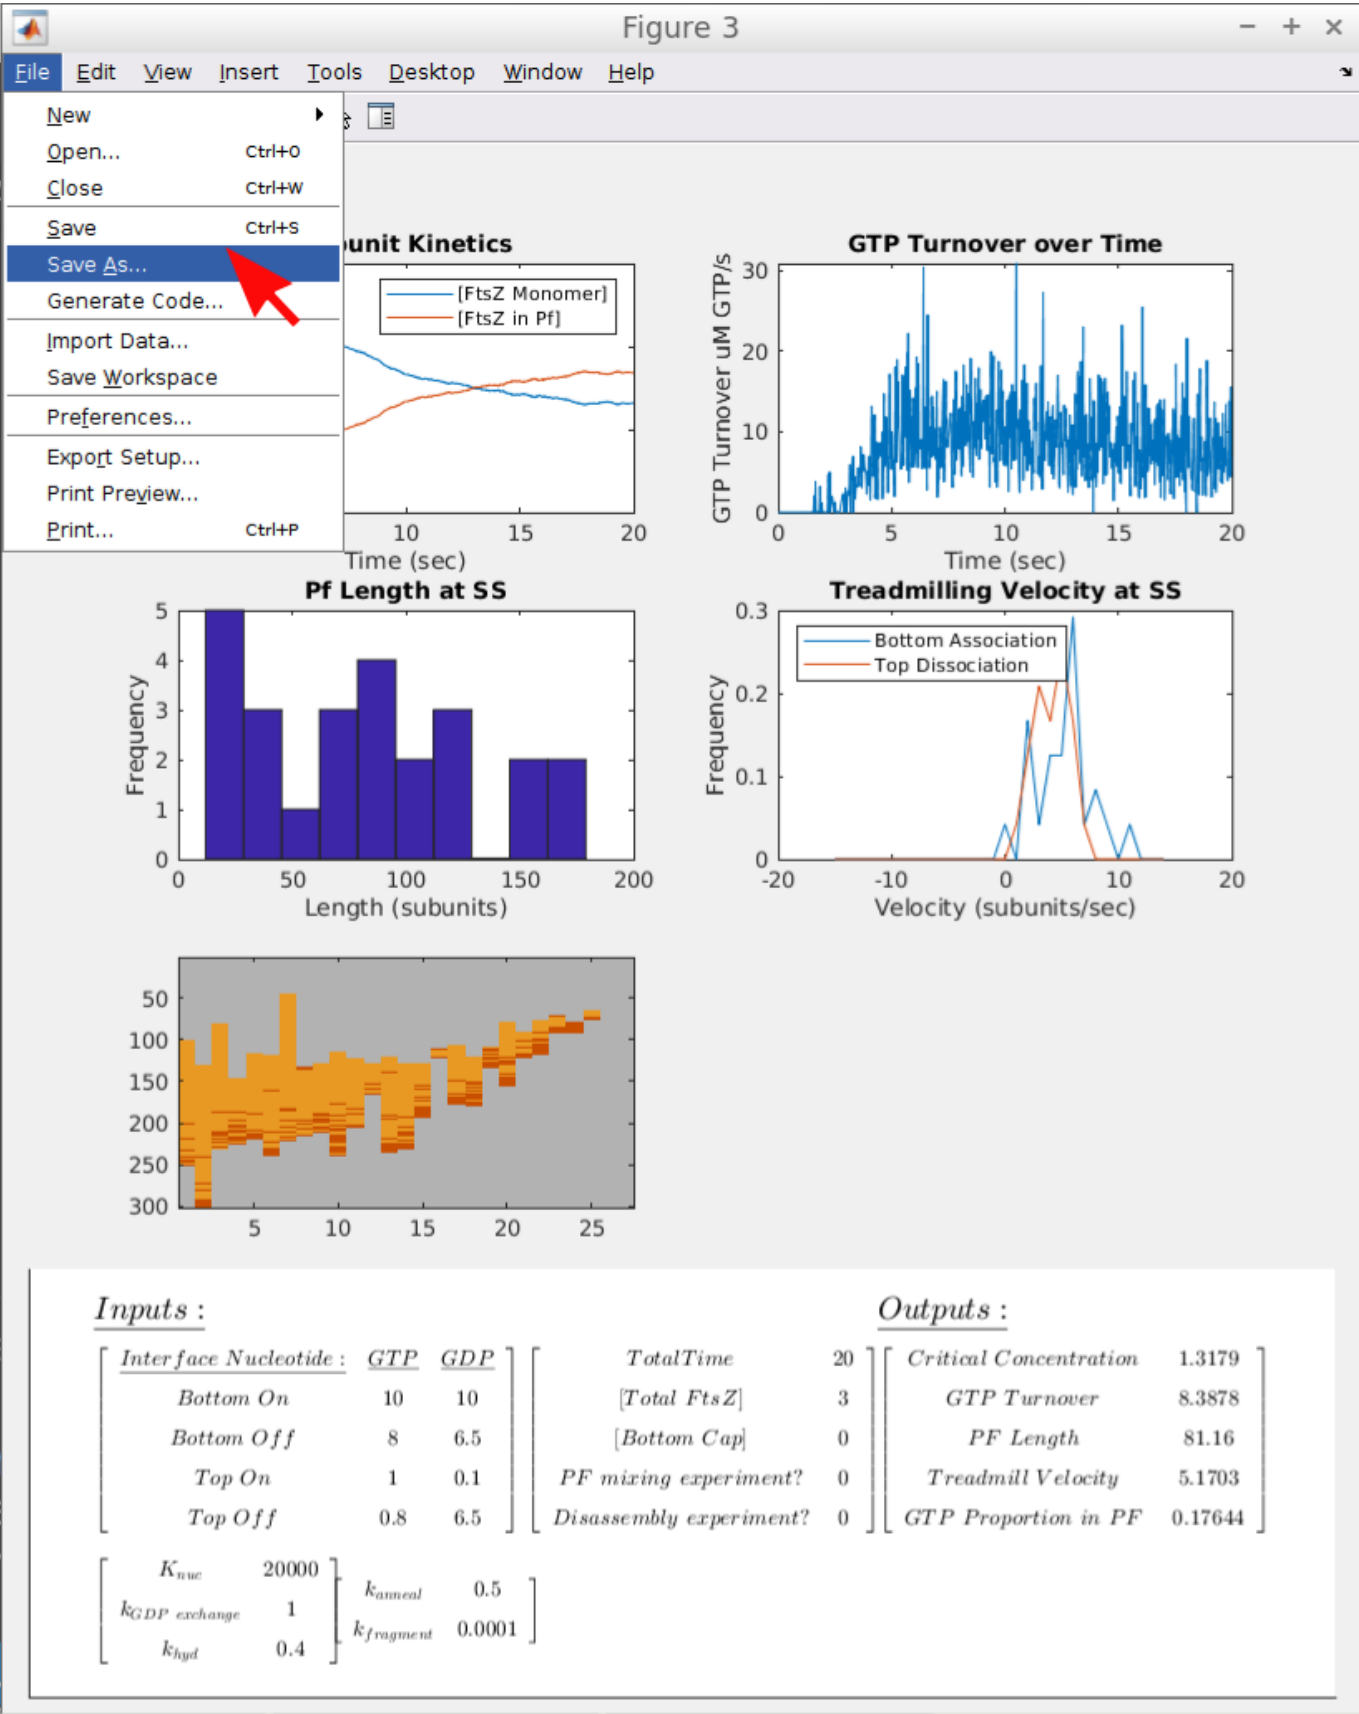

Navigating App Input

The left panel of the screen gives the input parameters, and the right panel shows results. The model comes with a set of kinetic parameters, FtsZ concentration (3 μM) and time (20 s), which can be used for an initial run by clicking the green **Run** button at the bottom. User can change any parameter by changing the number in the input boxes. To run model, click the green **Run** button at the bottom.

The output panel will show the final array of PFs in the top window. Each vertical line is a PF, with length shown on the y axis. GTP is red and GDP is orange. User can reply this as a movie by clicking **Play**, and can **Pause** at any point.

The bottom output panel can be toggled between Assembly, GTP turnover, etc., by clicking on the bar. To obtain a summary of input and output, click the **Export** button. Matlab will generate a figure that contains the input and output data from that particular model run. Save in your preferred format by clicking **File** and **Save As** on the menu bar.

To add a bottom capper, click the gray **Add Bottom Cap** button at the bottom left. In the popup, adjust the kinetic parameters and the concentration of capper with numeric inputs. Press **Apply** and the green **Run** button.

To undo adding a bottom capper, click **Add Bottom Cap**, and input 0 for the **Bottom Cap (μM)** numeric box. Click **Apply**. Accept the warning message. Continue with app.

PF Mixing Experiment

To simulate PF mixing, click the gray **PF Mixing Experiment** button. In the small popup, add a numeric time value in seconds. Click **OK**, then **Run**.

To undo adding a PF mixing experiment, click the **PF Mixing Experiment** button, and click **Cancel** in the popup.

PF Disassembly Experiment

To simulate PF mixing, click the gray **PF Disassembly Experiment** button. In the small popup, add a numeric time value in seconds. Click **OK**, then **Run**.

To undo adding a PF disassembly experiment, click the **PF Disassembly Experiment** button, and click **Cancel** in the popup.
